APRESENTAÇÃO

Trata o presente relatório de um produto complementar do Convênio TT 102/2007 – Projeto “Identificação de Sistemas de Pesagem em Movimento”, firmado entre o Departamento Nacional de Infra-estrutura de Transportes - DNIT e a Universidade Federal de Santa Catarina – UFSC.

Retrata o presente relatório da apresentação dos resultados da pesquisa de caracterização da frota da BR 101/SUL/SC entre os quilômetros 418 e 419 realizada no período de 24 de junho de 2008 à 02 de julho de 2008.

O relatório apresenta a tecnologia e equipamentos utilizados para coleta de dados e apresenta os resultados compilados na forma de gráficos e tabelas.

Faz parte do presente relatório uma planilha com todos os dados individuais dos veículos catalogados na pesquisa.

CAPÍTULO 1 – INTRODUÇÃO

1 INTRODUÇÃO

O conhecimento prévio da característica da frota no trecho a ser analisado é de grande importância para a qualidade dos dados a serem obtidos por sistemas de pesagem em movimento (WIM) utilizando-se da tecnologia de múltiplos sensores (MSWIM).

Fundamental pois, é conhecer, os diversos tipos de veículos que compõem a frota, suas velocidade média e o tipo de suspensão dos mesmos.

Estas informações servirão entre outras aplicações, para determinar:

- ⊙ Quantidade de sensores a serem instalados;
- ⊙ Disposição dos sensores sobre o pavimento (layout);
- ⊙ Alimentar o Modelo do sistema de Pesagem elaborado;

Assim sendo, de forma a conhecermos a característica da frota na BR 101/SUL/SC entre os quilômetros 418 e 419 – Posto de Pesagem de Araranguá, é que foi realizada a pesquisa de tráfego.

Para verificar o universo amostral dos transportes rodoviários, fez-se necessário a utilização de mecanismos que permitissem uma contagem precisa (erro inferior a 99%) nos momentos de maior tráfego na malha, sendo então utilizado para tal um radar laser estático com captura de imagem e todo aparato para o serviço proposto.

De vital importância para a pesquisa, foi não despertar a atenção dos usuários da via, quanto ao equipamento no local, de forma a evitar qualquer falso resultado; assim, os equipamentos foram instalados no interior de um veículo, estacionado de forma a não interferir com a operação da rodovia.

Inicialmente observou-se que o fluxo mais intenso concentrava entre as sete horas e trinta minutos e as dezessete horas e trinta minutos (07h30min – 17h30min), razão pela qual a pesquisa foi realizada dentro do período mencionando.

CAPÍTULO 2 – EQUIPAMENTO UTILIZADO

2 EQUIPAMENTO UTILIZADO

O Visual Speed é um radar Laser (LIDAR) de alta precisão, contando com módulos O.C.R. e iluminação com flash Infra Vermelho que associado a um sistema de processamento de dados e captura de imagem permite de forma automática e precisa medir a velocidade de todos os veículos que passam na via, registrando sua imagem pela traseira ou dianteira com a possibilidade de um registro lateral para caracterização dos demais parâmetros da pesquisa.

2.1 Modo Operacional

Os trabalhos foram realizados no período de 24 de junho de 2008 à 02 de julho de 2008 com os equipamentos instalados nas proximidade do posto de pesagem de Araranguá, diariamente entre 7h30min. às 17h30min., excetuando-se os dias 28 e 30 de junho.

O Visual Speed foi instalado no interior de um veículo, de forma discreta, que teve no seu interior as baterias e material necessário para a operação, além de um técnico e um engenheiro responsável.

O equipamento registrou a imagem pela traseira do veículo e com a instalação de uma câmera auxiliar a captura da lateral do veículo, procurando uma melhor identificação do mesmo quanto a número de eixos e modelo de carroceria. Os disparos das máquinas estavam programados no mesmo momento, tendo assim uma perfeita sincronia. Os dados primários (imagens) obtidos foram organizadas por data e estão arquivadas em mídia eletrônica.

Após as coletas, desenvolveu-se o processamento dos dados dos veículos de carga capturados.

Através de um sistema manual cada imagem foi lida e a placa do veículo foi consultada no RENAVAN, a partir deste foi desenvolvida uma planilha, que está apresentada na íntegra no Anexo I, contendo os seguintes dados:

- ⊙ Data/hora de registro do veículo (DD/MM/AA – HH:mm:ss).
- ⊙ Velocidade (acurácia melhor que 10%)
- ⊙ Identificação da Fotografia

- ⊙ Enquadramento na tabela de composições homologadas para transporte de cargas (portaria 86 de 20 de Dezembro de 2006 do Departamento Nacional de Trânsito - DENATRAN);
- ⊙ Tipo de Suspensão (Mecânica ou Pneumática);
- ⊙ Placa do Veículo;
- ⊙ Marca / Modelo do veículo de transporte (carga ou passageiro);
- ⊙ Ano do Veículo.

CAPÍTULO 3 – RESULTADOS COMPILADOS

3 RESULTADOS COMPILADOS

O serviço de engenharia de tráfego realizado visando obter a classificação da frota da BR101 Sul Km 418/419 ateve-se a uma contagem classificatória somente de veículos de carga, caracterizando-se pelo fornecimento dos seguintes dados: data, hora; velocidade; foto do veículo; tipo do veículo (classificação do DNIT); Placa; Renavan; marca/modelo e ano de fabricação. Os dados obtidos foram apresentados em planilha eletrônica e os resultados consolidados são apresentados e comentados a seguir.

A Tabela 1 apresenta, dia a dia, as quantidades de veículos de carga subdivididas em duas categorias: ônibus e caminhões. Observa-se que em média, registrou-se o tráfego de 833 veículos de carga no período de contagem, sendo que no dia 24 de junho (terça-feira) foi registrado o menor volume, com 572 veículos e no dia 02 de julho (quarta-feira) o maior volume, com 1029 veículos de carga trafegando no local.

Tabela 1 – Quantidade de veículos de carga (caminhões e ônibus) catalogados na pesquisa de tráfego realizada entre os dias 24 de junho a 02 de julho de 2008 – BR101Sul Km 418/419.

Data	Ônibus		Caminhões		Total de Veículos
	Quantidade	%	Quantidade	%	
24/jun	29	5,1%	543	94,9%	572
25/jun	38	4,3%	851	95,7%	889
26/jun	25	2,8%	874	97,2%	899
27/jun	21	2,4%	854	97,6%	875
29/jun	21	2,8%	730	97,2%	751
01/jul	28	3,4%	792	96,6%	820
02/jul	30	2,9%	999	97,1%	1029
Total	192	3,3%	5643	96,7%	5835

A Figura 1 apresenta graficamente a relação entre caminhões e ônibus registrados durante o período de coleta. Observa-se que no período de realização da contagem classificatória, foram catalogados um total de 5835 veículos de carga, sendo 96,7% de caminhões e 3,3% de ônibus.

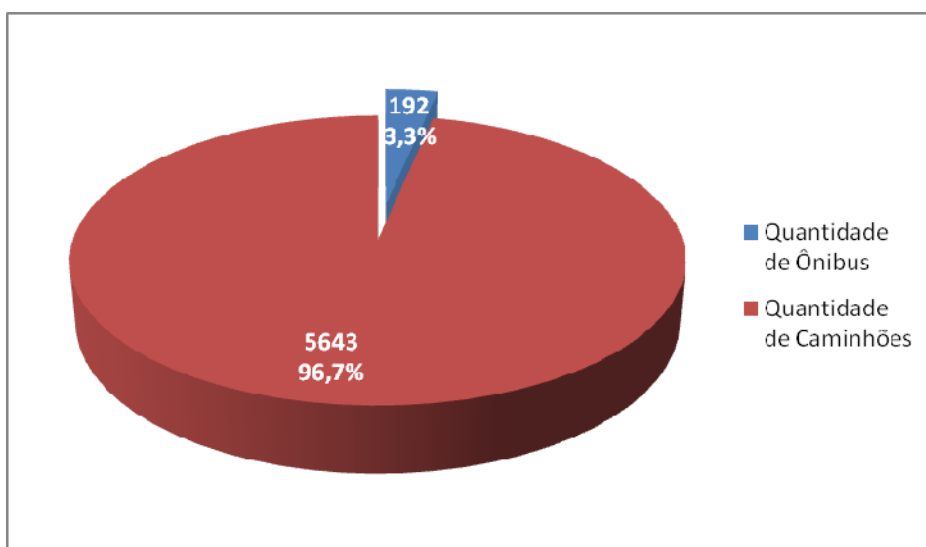

Figura 1 – Quantidade de veículos de cargas registrados durante o período de coleta de dados.

A análise dos dados coletados mostrou que a grande maioria dos veículos de carga utilizam suspensão mecânica, num total de 93,1% da amostra, sendo que somente 6,9% da frota utiliza suspensão a ar, como pode ser visualizado na Tabela 2

Tabela 2 Tipo de suspensão utilizada pelos veículos de carga (caminhões e ônibus) catalogados na pesquisa de tráfego realizada entre os dias 24 de junho a 02 de julho de 2008 – BR101Sul Km 418/419.

Data	Suspensão Mecânica		Suspensão a Ar		Total de Veículos
	Quantidade	%	Quantidade	%	
24/jun	536	93,7%	36	6,3%	572
25/jun	821	92,4%	68	7,6%	889
26/jun	842	93,7%	57	6,3%	899
27/jun	805	92,0%	70	8,0%	875
29/jun	716	95,3%	35	4,7%	751
01/jul	770	93,9%	50	6,1%	820
02/jul	945	91,8%	84	8,2%	1029
Total	5435	93,1%	400	6,9%	5835

Quanto a idade da frota, na amostra coletada, observou-se veículos de carga com até 48 anos, sendo que a idade média da frota é de aproximadamente 11 anos. 19% dos veículos de carga foram fabricados entre 1996 e 2000 e 81,3% da frota analisada tem até 17 anos de vida, como pode ser visualizado na Tabela 3

Tabela 3 Idade dos veículos de carga (caminhões e ônibus) catalogados na pesquisa de tráfego realizada entre os dias 24 de junho a 02 de julho de 2008 – BR101Sul Km 418/419.

Ano de Fabricação	Veículos de carga (caminhões e ônibus)							Total	%
	24/jun	25/jun	26/jun	27/jun	29/jun	01/jul	02/jul

Nota: *ano de fabricação não identificado na base do Detran

O Gráfico apresentado na Figura 2 mostra a distribuição da idade dos veículos de carga por faixa de ano de fabricação.

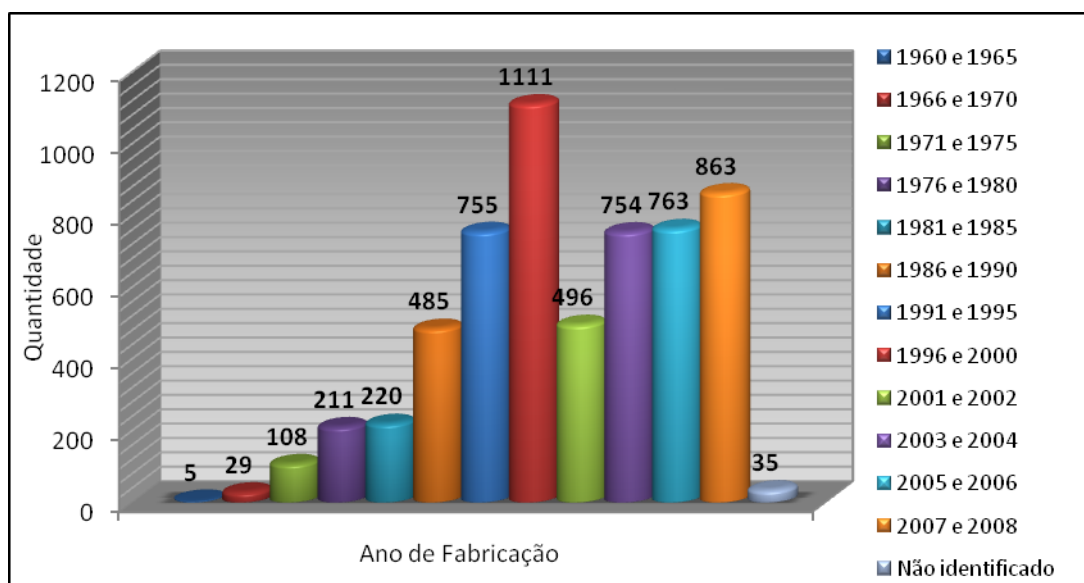

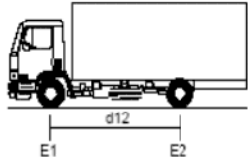

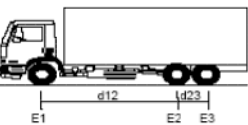

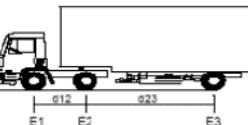

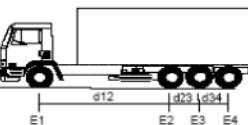

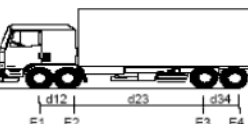

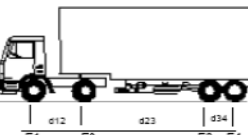

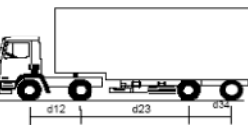

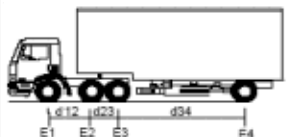

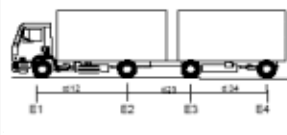

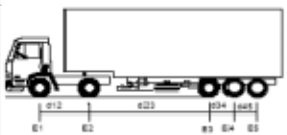

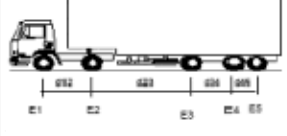

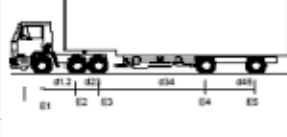

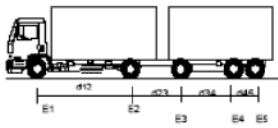

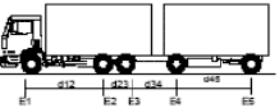

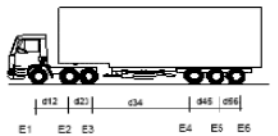

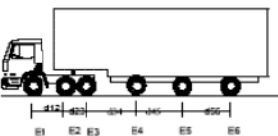

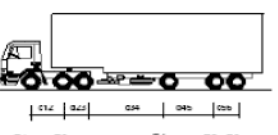

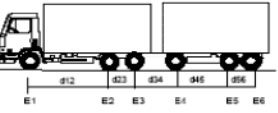

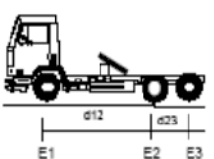

Figura 2 – Distribuição da frota por faixa de ano de fabricação

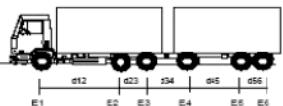

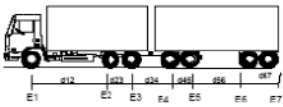

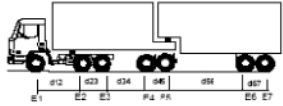

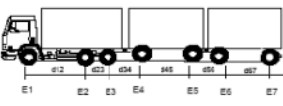

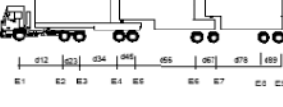

A classificação dos veículos de carga é um dado essencial para caracterização da frota. A partir da classificação do veículo é possível identificar as características relacionadas como os parâmetros para determinação do peso dos veículos de carga.

A classificação dos veículos adotada pelo DNIT apresenta as configurações básicas de cada veículo ou combinação de veículos, bem como número de eixos, seu PBT máximo e sua classe, a qual é apresentada na Figura 3.

SILHUETA	Nº DE EIXOS	PBT/CMT MÁX.(t)	CARACTERIZAÇÃO	CLASSE
	2	16(16,8)	CAMINHÃO E1 = eixo simples (ES), rodagem simples (RS), carga máxima (CM) = 6t ou capacidade declarada pelo fabricante do pneumático E2 = ES, rodagem dupla (RD), CM = 10t d12 3,50m	2C

Graficamente os totais de veículos por classes podem ser visualizados na **Erro!**
Fonte de referência não encontrada..

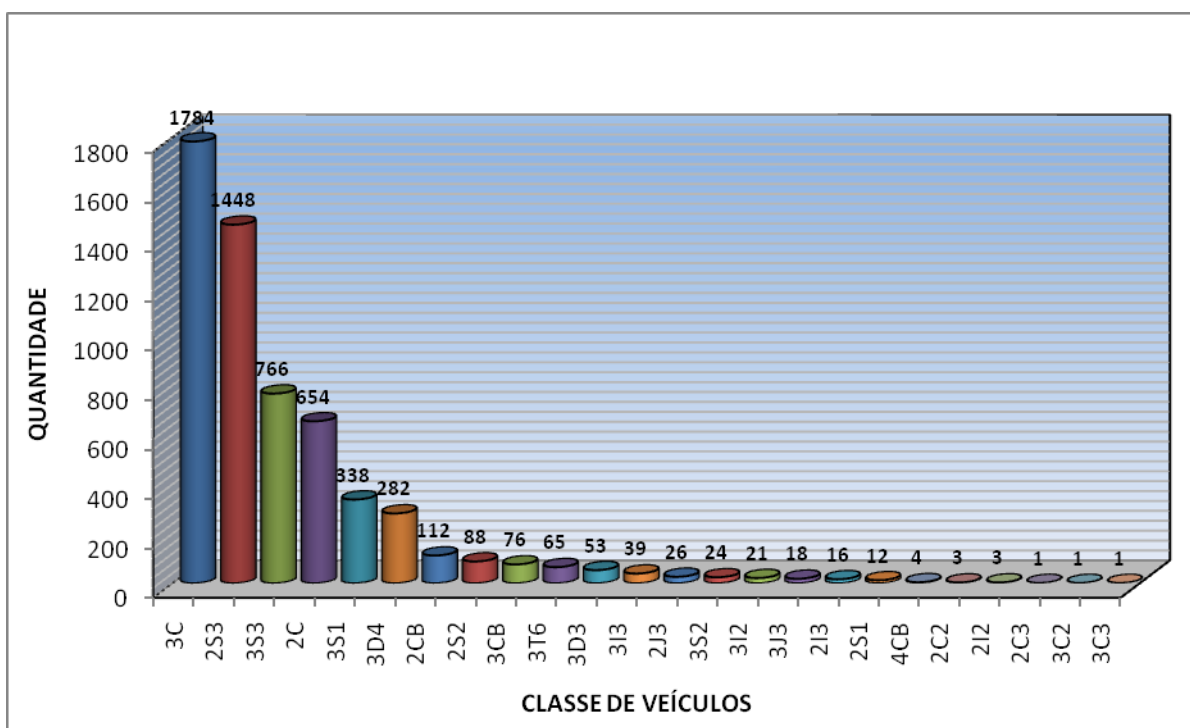

Figura 4 – Total de Veículos por Classe, segundo classificação do DNIT.

Analisando os dados, observa-se que somente quatro classes de veículos representam aproximadamente 80% dos veículos passantes, a saber: classe 3C com 30,57%, 2S3 com 24,82%, 3S3 com 13,13% e 2C com 11,21%. do total de veículos, as quais serão consideradas as classes relevantes para efeito desta pesquisa, descartando a análise das demais. Desta forma, a Tabela 5 sintetiza as classes relevantes cujos dados serão utilizados para efeito de caracterização da frota no trecho em análise.

Tabela 5 Veículos por classes relevantes catalogados na pesquisa de tráfego realizada entre os dias 24 de junho a 02 de julho de 2008 – BR101Sul Km 418/419.

Classificação DNIT	Veículos de carga (caminhões e ônibus)	
	Quantidade	%
3C	1.784	30,57%
2S3	1.448	24,82%
3S3	766	13,13%
2C	654	11,21%
Outras	1.183	20,27%
Total	5.835	100,00%

Uma vez conhecidos os veículos mais representativos da frota na área escolhida para a realização da pesquisa de múltiplos sensores, os próximos passos para a calibração e realização dos testes, serão: a instrumentação dos veículos mais representativos observados e a análise dos dados coletados da instrumentação e a realização de uma simulação em computador do comportamento dinâmico dos veículos pesquisados. Estes serviços complementarão a caracterização da frota objeto deste relatório.

Outra informação obtida durante a coleta de dados e que servirá de parâmetro para especificação dos sistemas de pesagem em movimento a serem instalados foi a velocidade instantânea de tráfego no ponto onde foram coletadas as informações. Observa-se na Tabela 6 que a maior frequência de velocidade situa-se na faixa de 61 a 70 km/h com 34,27% da amostra. Constata-se também que a velocidade de fluxo de 83,31% dos veículos de carga da amostra ficou entre 51 e 80 km/h. Ressalta-se que a velocidade observada pode ter sido influenciada pelas obras de duplicação da BR101Sul em curso e/ou o alto volume de tráfego na via.

Observa-se que a velocidade dos veículos de carga representativos da frota (3C, 2S3, 3S3 e 2C) não difere da velocidade da amostra total como pode ser visto no gráfico apresentado na Figura 5**Erro! Fonte de referência não encontrada..**

CAPÍTULO 4 – CONSIDERAÇÕES FINAIS

4 CONSIDERAÇÕES FINAIS

O serviço de caracterização da frota realizado na BR 101Sul Km 418/419 entre os dias 24 de junho a 02 de julho de 2008 identificou a frota representativa do trecho a qual é composta por quatro tipo de veículos: classe 3C com 30,57%, 2S3 com 24,82%, 3S3 com 13,13% e 2C com 11,21%. do total de veículos. Os dados coletados apontam para um volume de tráfego semanal na ordem de 5.835 veículos de carga, o que representa uma média diária de 834 veículos de carga/dia.

As informações coletadas e as análises realizadas remetem para a necessidade de instrumentar os veículos de carga representativos da frota, e medir, com planejamento estatístico, variáveis associadas ao comportamento da Força de Impacto vertical (Fi) na interface pneu/pavimento de rodas especificadas, à medida que os mesmos operam em um trecho de estrada determinado, sob condições de carga e velocidade especificadas, compatíveis com os catalogados na amostra colhida

Dados primários obtidos de veículos de carga em operação real precisam ser analisados e receber tratamento adequado, de forma a poder alimentar modelos matemáticos para análise da interação veículo/pavimento com o intuito de conhecer o comportamento dinâmico da força aplicada ao pavimento pelas rodas dos veículos de carga em operação na rodovia, para permitir determinar o número e espaçamento dos múltiplos sensores de carga usados em sistemas MS-WIM, como função da acurácia exigida na pesagem em movimento.

Outra informação imprescindível para a determinação da precisão alcançável em sistemas MS-WIM, como função do número e espaçamento dos sensores, objetivo central do projeto NEP/FAPEU-DNIT é a determinação do comportamento dinâmico (análise temporal e espectral) da Força de Impacto vertical (Fi) na interface pneu/pavimento de todas as rodas de veículos virtuais, de classe, parâmetros mecânicos da suspensão e níveis de carregamento especificados a partir da Determinação prévia dos parâmetros mecânicos das suspensões mais representadas na frota observada na pesquisa de tráfego.
